"Antigen Distribution in the Tissue of Dogs in Anaphylactic Shock."

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol XXX, No 1, 1966, pages 99-105.

Abstract: [English article, authors' English summary modified] Anaphylactic shock was induced in dogs by means of ^{51}Cr labelled egg albumin. The control animals received ^{51}Cr labelled egg albumin but no shock was induced in them. In the controls, activity was highest in the blood followed, in decreasing order, by that in the liver, kidney, spleen, lung, urine, heart, intestine, skeletal muscles and brain. In the test animals, the activity in the blood and lungs was higher than that in the controls if the second injection was into the saphenous vein; after intraportal injection, the highest activity was measured in the liver. The disappearance of mast cells of the animals in shock was 70 per cent from the liver, 39 per cent from the lungs and 30 per cent from the ear. 4 Hungarian, 11 Western references. 5

Using the methods of Vinogradov and Hardy-Littlewood the author proves the following theorems. 1) Let $k \geq 1$, $(g_j, k) = 1$ ($j=1, 2, 3$). Denote by $N(n)$ the number of representations of $n = p_1 + p_2 + p_3$, p_j prime, $p_j \equiv g_j \pmod{k}$, $j=1, 2, 3$. Then if $n \equiv g_1 + g_2 + g_3 \pmod{k}$, n odd,

$$N(n) = \frac{k}{\phi(k)^3} \prod_{p|k, p \nmid n} \left(1 - \frac{1}{p^2 - 3p + 3}\right) \times \prod_{p \nmid k} \left(1 + \frac{1}{(p-1)^2}\right) \frac{n^2}{2(\log n)^3} + o\left(\frac{n^2}{(\log n)^3}\right).$$

2) Let $k_j \geq 1$, $(k_j, k_{j'}) = 1$, $(g_{j'}, k_j) = 1$ ($j, j'=1, 2, 3$). Let $N(n)$ denote the number of solutions of $n = p_1 + p_2 + p_3$, $p_j \equiv g_j \pmod{k_j}$. Then

$$N(n) = \phi(n) \frac{n^2}{2(\log n)^3} + o\left(\frac{n^2}{(\log n)^3}\right)$$

where $\phi(n)$ is given by a complicated expression.

These results sharpen previous results of Van der Corput [Math. Ann. 116, 1-50 (1938)].

"Thoughts on Some Problems Pertaining to Animal Hygiene Administration."

Budapest, Magyar Allatorvosok Lapja, Vol 21, No 6, Jun 1966, pp 245-246.

Abstract: A general discussion of the factors involved in animal hygiene administration with special emphasis on the situation created by the implementation of the socialist system in Hungarian agriculture. Much improvement is required. However, the author cautions that only legal means should be employed. Persuasion is likely to be more effective than force. Best cooperation can be ensured by educational activity and by intelligent supervision. Responsibility should be clearly defined and the aim should be to improve and increase production. ORV. HETIL. 1956, 97/21 (573-577) Graphs 2 Tables 1

For differentiation of affections associated with various functional conditions of the thyroid load tests were carried out with TSH. In cases of thyrogenic hypothyroidism the PBI value remained completely or almost unaltered after administration of TSH, whereas this value showed a marked increase following administration in cases of hypothyroidism of central origin. Whereas the PBI showed a marked increase in euthyroid subjects treated with TSH, there was only a slight increase in hyperthyroid subjects. This phenomenon was attributed to the decreased iodine content of the gland in hyperthyroidism. The results obtained led to the conclusion that this pathophysiological phenomenon can be used as an aid in the differential diagnosis of mild hyperthyroidism.

Univ.-Klin., Budapest; Med.-Physikal. Inst., Budapest - ACTA MED. ACAD. SCI. HUNG. 1959, 13/1-4 (71-78) Graphs 1 Tables 6

The effect of reserpine and amphetamine on thyroid function was studied. Experiments with I^{131} showed that the rat thyroid reacted to the amphetamine, which predominantly excites the sympathetic nervous system, in the dose used, just as it reacts to acute stress. In addition to an increased urinary excretion of I^{131} there was a decrease of the capacity of the thyroid to accumulate I^{131} ; also, the rate of thyroid hormone secretion was transiently somewhat diminished. Experiments with large doses of reserpine resulted only in a transient decrease of the rate of thyroid hormone secretion.

"Data on the Clinical Evaluation of the Test Based on the I-131-Triiodo-
Thyronine Uptake of the Erythrocytes."

Budapest, Orvosi Hetilap, Vol 103, No 50, 16 Dec 62, pages 2366-2369.

Abstract: [Authors' summary] The authors discuss the clinical usefulness of the test. It can be carried out easily and is a useful supplement to other tests for the evaluation of thyroid function. The patient is not exposed to radiation damage, the test can be carried out after contamination with organic iodine or after treatment with I-131 as well. It gives normal values even in euthyretic cases of high thyroid I-131 uptake and the success of an applied I-131 therapy can be followed by this method. The authors call attention to the extrathyroidal causes which influence the value of the test.

"Scintigram Examinations of Benign, Non-Toxic and Toxic Goiters."

Budapest, Orvosi Hetilap, Vol 104, No 10, 10 Mar 1963, pages 450-453.

Abstract: [Authors' Hungarian summary] The authors report their observations during scintigram examinations of benign, toxic and non-toxic nodular goiters. The inactivation of the thyroid tissue around the "hot" nodule is discussed in detail. Based on the clinical picture and laboratory tests, toxic adenomas are divided into compensated and decompensated forms. Scintigram examinations before and after triiodo-thyronine are useful for the demonstration of dependent or autonomous state of the thyroid nodule. 12 Western, 5 Hungarian references.

Fractions made from heat-killed tb bacilli were used to sensitize red cells for specific agglutination. One fraction (P₁) extracted with methanol buffer solution was capable of sensitizing red cells, while a fraction (P₂) obtained by means of weak alkaline hydrolysis inhibited the agglutination of red cells treated with P₁. A chemical analysis revealed that both fractions contained polysaccharide. The P₁ material contains ribo- and desoxyribonucleic acids also. These were not found in fraction P₂ which possesses only an inhibitory effect. It is stated that the nucleic acid moiety is responsible for the adsorption of P₁. Ivánovics - Szeged (IV, 15)

MICROBIOL. ACAD. SCIENT. HUNG. (Budapest) 1957, 4/1 (43-57) Tables 13
Further evidence confirming the author's statement that a polysaccharide-nucleic
acid moiety isolated from tubercle bacilli is responsible for the specific sensitiz-
ation of red blood cells in Middlebrook and Dubos test. Extracts obtained from
dried tubercle bacilli by mild treatment were fractionated by uranyl- and lathan-

2618

acetate. The precipitate carried the specific substance capable of sensitizing red blood cells, while the supernatant had only an inhibiting property due to its unbound specific polysaccharide.

The addition of cholesterol to non-ionic surface-active detergents of the Tween type largely inhibits the red cell-haemolysing action characteristic of these agents. It is therefore assumed that the haemolysing effect is the result of the action of these substances on the cell membrane (Schulman, J. H. and Rideal E. K. Proc. Roy. Soc. Series B. 1939, CXXII, 29). The author has demonstrated in vitro that the addition of cholesterol to the non-ionic detergent Tween 60 (polyoxyethylene-sorbitan-monostearate) has a strong protective effect on lipo-protein surfaces (artificial cell membranes). The author also experimented on white male mice. 12% cholesterol added to 25% aqueous solution of Tween 60 significantly inhibited the epidermal hyperplasia characteristic of Tween 60. The addition of cholesterol to Span 20 (sorbitan-monolaurate) and to Tween 20 (polyoxyethylene-sorbitan-monolaurate) had no effect.
